## 1. Patch October 2019

The chapter below describes changes and updates done to existing features that were made during our October patch. Different Dapresy installs were updated on different dates.

### 1.1 Administration

#### Export raw data

The raw data export logic is updated to stop the data export in case duplicate variable names are included in export file as duplicated variable names are not supported in SPSS. Also, the email notification in case of successful or failed export is changed. If export fails, user will get an email message indicating that the export failed and that Dapresy support should be contacted.

### 1.2 Import Data

#### Decimal places

With the latest patch we upgraded the precision when importing Excel numeric data. In very specific cases when file contains numeric values there was an issue with Excel rounding logic.

### 1.3 Document Archive

#### Hierarchical Filter

The performance and loading time of Document archives that have large number of hierarchical filter nodes is upgraded. The Hierarchical filters have been added to in memory which reduces the loading time and improves overall performance in the Document archive.

### 1.4 Benchmarks

#### Calculations with missing period to compare against

Due to an issue that has been resolved, previously benchmark values that had no previous period to compare against showed the underlying data value. This has been fixed and now correctly displays a “-“ to indicate no benchmark calculation can be completed.
