1. Patch April 2019

The chapter below describes changes and updates done to existing features that were made during our April patch. (Different Dapresy Pro installs were updated on different dates.)

1.1 Administration

Compute variable

An update to fix an issue in the maintenance of compute variables. If we tried to delete a compute variable which was not used in any reports we would get an error: "Cannot delete Compute variable because it is used in some reports" even if it wasn't actually being used, with this patch now only a compute variable which was used in reports will get this error.

1.2 Storyteller

Decimal places

In field "No. of decimals" we have added a maximum value validation. If the user enters a number of decimal places greater than 15 and continues, the value will set itself to 15 decimal places.

Clean and Recode data

Date variable type is removed from the list of available questions for recording and cleaning.
